Purpose

The `dc_shell` program implements a simple Unix shell program. The shell can execute simple commands with I/O redirection and will expand `~` to the user's home directory. Only the `cd` and `exit` built-in commands are supported.

Requirements

| Task | Status |
|---|-------------------|
| Read commands | Fully implemented |
| Execute commands | Fully implemented |
| Redirect stdin | Fully implemented |
| Redirect stdout with concatenation or appending | Fully implemented |
| Redirect stderr with concatenation or appending | Fully implemented |
| Expand <code>~</code> to the users home directory | Fully implemented |
| (bonus) <code>which</code> building command | Not implemented |
| (bonus) command history with up and down arrows | Not implemented |

Platforms

`dc_shell` has been tested on:

- macOS Monterey Version 12.5
- Fedora 34

Language

- ISO C17
- Compiles with gcc and clang
